

Weekly Knowledge Base Maintenance SOP

Audience: Any BTS admin · Cadence: Once per week (Mon/Tue recommended) · Time: ~15–30 min for a healthy queue

What Feeds the Knowledge Base

Here's what actually feeds the KB:

- Coaching call transcripts — 1-on-1 session recordings get parsed and turned into teaching/troubleshooting docs.
- Blitz training videos — video audio is transcribed and converted into structured guides.
- General video transcripts — bulk transcript files processed into KB-ready docs.
- Manual admin actions — merging duplicate docs, or adding/editing a doc by hand on the Live Documents page.
- Seed data — baseline docs loaded during setup.

How the Auto-Triage System Works

New KB documents land in a staging area and are auto-scored by AI before a human sees them:

AI outcome

High-confidence approve ("e 85%)

Low-confidence reject ("d 20%)

In-between

What happens automatically / What you do

Auto-approved and queued for push. Nothing — verify in audit log if you want.

Auto-rejected. Nothing — optionally audit and undo.

Flagged as needs_review. This is your weekly job.

Your only recurring task is clearing the needs_review queue. Pushed docs go live to the AI assistant immediately — no restart needed.

Weekly Routine (Checklist)

1. Navigate — Admin panel !' Knowledge Base !'
Document Review
2. Check the triage banner — Wait if triage is running; click Run AI Triage to score new arrivals first
3. Clear the needs_review queue — Use Review Queue guided mode. For each doc: approve (A), reject (R), edit inline (E, auto-approves), or Merge duplicates.
Shortcuts: A/R/E · !'/N next · !•/P previous
4. Push live — Click Push N to KB (pushes both human- and AI-approved docs at once)
5. Spot-check the assistant — Ask the member-facing chat a couple of questions on what you just pushed; fix via Live Documents if wrong
6. Quick audit (optional) — View Audit Log to review AI auto-actions; Undo anything wrong

Understanding the Page Controls

Two buttons on the Document Review page only appear

conditionally:

- "Review Queue (N)" — only shows up when there are documents waiting in the needs_review queue. If nothing currently needs review, the button is hidden.
- "Push N to KB" — only shows up when there are approved documents ready to push. If you haven't approved anything (or AI hasn't auto-approved anything), it's hidden too.

The other controls are always there in the top-right of the page:

- Run AI Triage (scores pending docs)
- Run Pipeline (see section below)
- Settings (the gear icon — auto-approve / auto-reject thresholds)
- View Audit Log (appears in the triage results banner)
- Merge (appears once you select two or more docs in the list)
- The A / R / E and !/N · !/P keyboard shortcuts work once you're inside Review Queue guided mode.

Note on View Audit Log: it only shows up after a triage run actually auto-approves or auto-rejects something. If everything is already pushed (nothing pending or needing review), there's nothing to report, so the banner — and the button — stay hidden. Add new docs, click Run AI Triage, and it'll reappear.

Run Pipeline

The Run Pipeline button converts raw coaching-video transcripts into clean, structured knowledge-base draft articles. When clicked it:

1. Reads the stored raw video transcripts.
2. Cleans them (removes filler words and messy speech).
3. Rewrites each one with AI into a structured training document (title, category, headings, numbered steps, key takeaways) with BTS branding enforced.
4. Saves the results to the staging area as "pending review" (nothing goes live automatically).
5. Auto-triages the new drafts (auto-approve or flag for human review).

It runs in the background. It will NOT run if the staging area already has documents — it stops and asks you to clear staging first, so clicking it repeatedly is safe (no duplicates). To publish reviewed drafts, use the separate "Push to KB" button.

Use this only when there are new raw transcripts to import; it is not a day-to-day action.

Managing Live Documents

Knowledge Base !' Live Documents: search/filter, edit (live immediately), add manually, or delete.

One-Time Backlog Cleanup

Use this mode when the needs_review queue has piled up — for example, if it was ignored for a while. It's a temporary catch-up routine, not your regular weekly cadence:

Step

Run AI Triage first to shrink the queue

Work needs_review in guided-mode sessions (prioritize coaching-call content)

Push incrementally

Repeat daily until clear, then return to weekly cadence

What it means

Let the AI score everything in staging before you start manually reviewing. This auto-approves high-confidence docs and auto-rejects low-confidence ones, leaving only the genuinely ambiguous ones for you.

Go through what's left using Review Queue guided mode. If time is limited, tackle coaching-call documents first — they tend to be highest-value for the assistant's accuracy.

Push batches as you go rather than waiting for the whole backlog to clear, so the assistant benefits from approved content right away.

Keep doing this once a day (instead of once a week) until the backlog is fully worked through, then go back to the normal Mon/Tue weekly routine.

Adjusting AI Triage Thresholds (Admin Only)

Document Review !' Settings (gear icon):

- Auto-approve threshold (default 85%)
- Auto-reject threshold (default 20%)

Save and re-run triage to apply.
