

Tips-and-Tricks Categorization SOP

Audience: Any BTS admin reviewing KB drafts · Applies to: weekly tips content (Nano Banana, Grok, Anstrex, headlines) ·
Where: Admin !' Knowledge Base !' Document Review

What “tips and tricks” content is

Short, tool-driven walkthroughs that show a member how to get one specific thing done — usually make or improve a creative, or write copy — often with a named piece of software. Not full curriculum modules and not coaching-call recordings. Current examples:

- Nano Banana — make / resize ad creatives in Google AI Studio (Gemini).
 - Grok Imagine — turn a static image into a short video / animated GIF.
 - Anstrex + Claude — find winning native ads and rewrite the copy.
 - Headlines in a specific style — generate headlines with Claude using the copy docs.
 - Caterpillar creative optimization — refresh a working campaign's creatives with AI.
-

The fields you leave as-is (set at intake)

Field	Value / Why
Format (source folder)	Other Video (other_video) — short single-presenter videos.
Authority	Curriculum — a BTS presenter is teaching; no dialogue to attribute.
Doc class	transcript (training-only, NON-CITABLE) — tips are mined as source, never cited to members. Do not promote to curated/overview. If any of these arrive set to something else, correct them back to the values above.

The one decision you make: home root + node

Step 1 — Pick the home root

Ask: is this a repeatable step in building a campaign, or a transferable skill?

- A repeatable campaign build step (“do this, then this to produce the asset”) !' Process (process).
- A cross-campaign skill or principle (how to think about copy / angles / testing) !' Concepts & Skills (concepts).
- Tips are almost never Operations (that root is membership / billing / support).

Step 2 — Pick the dominant node

Process nodes (most tips land here):

- creative-assets — THE DEFAULT for tips. Making, resizing, animating, or editing images / video / GIFs.

- Other process nodes only if clearly that stage: tracking-and-setup, launch, testing, scaling, network-and-offer, foundations, compliance.

Concepts nodes (skill/principle tips):

- headlines-and-copy — writing headlines, descriptions, ad copy.
- creative-strategy — how to THINK about creatives (vs the mechanical steps of building one).
- testing-methodology — how to structure / read tests.
- angles — choosing the marketing angle.

Step 3 — One tip, one dominant node

A tip often touches several nodes. Pick the SINGLE most dominant node — the thing the tip is really teaching. Do not record every related node here; secondary links are added later, automatically, at synthesis.

Rule of thumb: if the payoff is an ASSET you produced, it's Process / creative-assets. If the payoff is a WAY OF WRITING OR THINKING you'd reuse, it's a Concepts node.

Software is a tool tag, never a node

The specific software a tip uses (Nano Banana, Grok, Claude, Anstrex, Canva...) is a tool TAG, not a node. Never create or pick a node named after a tool.

- If the tool is already in the tag list, add it as a tag (0–4 tags per doc).
- If the tool is new, the AI analysis records it in the tool-tag PROPOSAL QUEUE for an admin to approve — it does not become a live tag on its own.

Tip — Home root / Node

Nano Banana — process / creative-assets

Grok Imagine — process / creative-assets

Anstrex + Claude — concepts / headlines-and-copy

Headlines in a specific style — concepts / headlines-and-copy

Caterpillar creative optimization — process / creative-assets

Worked examples (the current queue)

Tool tags / Why

nano-banana, caterpillar — produces an ad image (build step).

grok — produces a video/GIF creative (build step).

anstrex, claudé — teaches how to write copy (reusable skill).

claudé — teaches a headline-writing method (reusable skill).

caterpillar — refreshes/edits campaign creatives (build step).

Each also links to a secondary node in real life (e.g. the Anstrex tip touches creative-strategy). You still pick only the dominant node — synthesis handles the rest.

Nothing auto-publishes

The AI analysis only SUGGESTS the home root, node, tags, and cleaned title. Every suggestion lands in `needs_review` for you to accept or change, and nothing goes to members until a human approves it. Edit any suggestion you disagree with — your choice is the one that sticks.
